Food-Borne Illnesses Subject to Publication Bias

BY DENISE NAPOLI

Associate Editor

WASHINGTON — Publication bias creates a skewed picture of the true prevalence of restaurant-associated food-borne disease outbreaks in the United States, and this can lead to misdiagnosis, said Dr. Tim F. Jones, state epidemiologist for the Tennessee Department of Health.

"Ten percent of the people who came in to see their doctor for diarrhea got antibiotics. About 4% of them are cultured. And of course it's only a minuscule proportion of people who get cultured [in whom we] ever find a pathogen. So there are a ton of people out there getting unnecessary antibiotics," he added.

At the jointly held annual Interscience Conference on Antimicrobial Agents and Chemotherapy and the annual meeting of the Infectious Diseases Society of America, Dr. Jones presented data on a search of restaurant-associated outbreaks appearing in the medical literature from 1973 to the present. An "outbreak" was defined as a minimum of two cases of similar illness and common exposure.

Dr. Jones then compared the literature search results with outbreaks reported from 1998 through 2006 via the Center for Disease Control and Prevention's Electronic Foodborne Reporting System, or EFORS. State health departments are required to report all food-borne outbreaks to the CDC using this system.

A total of 133 published restaurant-associated outbreaks were found, compared with 7,300 unpublished reports in the EFORS.

Some stark differences emerged between the groups of published and unpublished reports. Of the 133 published reports, 121, or 91%, had an etiology identified vs. only 55% of unpublished reports. Also, the median number of persons reported ill in published studies was 72 vs. 5 in unpublished reports, Dr.

Botulism outbreaks accounted for 5% of published outbreaks, compared with 0.05% of all of those reported. Hepatitis A was identified as the etiology in 15% of published outbreaks vs. 3% of unpublished outbreaks with known etiology. And Norovirus, "far and away" the most common cause of outbreaks with a known etiology, was cited as the cause of an outbreak in 14% of published reports vs. 26% of the unpublished outbreaks.

Thus, publication bias can undermine physicians' ability to interpret the publicly available data on food-borne disease, he said. Novel pathogens or unusual circumstances surrounding the outbreak are obviously more likely to be published, Dr. Jones said. But the fear of negative publicity may also inhibit publication, especially when an outbreak is related to an infected food worker.

Among published outbreaks, one-third implicated food workers as a cause, compared with only 11% in unpublished outbreaks, Dr. Jones noted. When restricting the analysis to outbreaks with an identified etiology, the results were similar, with food workers implicated twice as often in published vs. unpublished studies.

Each year in the United States, approximately 76 million food-borne illnesses result in 5,000 deaths. From 1998 to 2006, a mean of about 1,250 outbreaks were reported annually, of which two-thirds were associated with foodpreparing restaurants or delicatessens, Dr. Jones added.

Brief Summary—see package insert for full prescribing information.

ARICEPT** (Donepezil Hydrochloride Tablets)

ARICEPT**ODT (Donepezil Hydrochloride) Orally Disintegrating Tablets

INDICATIONS AND USAGE ARICEPT** is indicated for the treatment of dementia of the Alzheimer's type. Efficacy has been demonstrated in patients with mild to moderate Alzheimer's Disease, as well as in patients with severe Alzheimer's Disease. CONTRAINDICATIONS ARICEPT® is contraindicated in patients with known hypersensitivity to donepezil hydrochloride or to association with the control of the control of the property of the expected to increase gastric acid secretion due to increased cholinergic activity. Therefore, patients should be monitored closely for symptoms of active or occult gastrointestinal bleeding, especially those at increased risk for developing ulcers, e.g., those with a history of ulcer disease or those receiving concurrent nonsteroidal anti-inflammatory drugs (NSAIDS). Clinical studies of ARICEPT* have shown no increase, relative to placebo, in the incidence of either peptic ulcer disease or gastrointestinal bleeding. ARICEPT*. a predictable consequence of its pharmacological properties, has been shown to produce diarrhea, nausea and vomiting. These effects, when they occur, appear more frequently with the 10 mg/day dose than with the 5 mg/day dose. In most cases, these effects elects, when they out, appeal more requestly with the total pay dose and with the oring day dose. Inflost cases, these event have been mild and transient, sometimes lasting one to three weeks, and have resolved during continued use of ARICEPT*. Confinements may cause bladder outflow obstruction. Neurological Conditions: Seizures: Cholinomimetics are believed to have some potential to cause generalized convulsions. However, seizure activity also may be a manifestation of Alzheimer's Disease. Pulmonary Conditions: Because of their cholinomimetic actions, cholinesterase inhibitors should be prescribed with care to patients with a history of asthma or obstructive Dulmonary disease. PRECAUTIONS Drug-Drug Interactions (see Clinical Pharmacology: Clinical Pharmacokinetics: Drug-drug Interactions). Effect of ARICEPT* on the Metabolism of Other Drugs: No in vivoclinical trials have investigated the effect of ARICEPT* on the clearance of drugs metabolized by CYP 3A4 (e.g. cisapride, terfenadine) or by CYP 2D6 (e.g. imipramine). However, in vitro studies show a low rate of binding to these enzymes (mean K, about 50-130 μM), that, given the therapeutic plasma concentrations of donepezil (164 nM), indicates little likelihood of interference. Whether ARICEPT* has any potential for enzyme induction is not known. Formal pharmacokinetic studies evaluated the potential of ARICEPT® for interaction with theophylline metidine, warfarin, digoxin and ketoconazole. No effects of ARICEPT® on the pharmacokinetics of these drugs were observed. *Effect* of *Other Drugs on the Metabolism of ARICEPT**: Ketoconazole and quinidine, inhibitors of CYP450, 3A4 and 50, respectively, inhibit done per ill metabolism in *initro*. Whether there is a clinical effect of quinidine is not known. In a 7-day crossover study in 18 healthy volunteers, ketoconazole (200 mg q.d.) increased mean done pezil (5 mg q.d.) concentrations (AUC $_{0.24}$ and C $_{0.024}$ and C $_{0.024}$ by 36%. The clinical relevance of this increase in concentration is unknown. Inducers of CYP 2D6 and CYP 3A4 (e.g., phenytoin, carbamazepine, dexamethasone, rifampin, and phenobarbital) could increase the rate of elimination of ARICEPT®. Formal pharmacokinetic studies oexamenasone, manipm, and prenovational) could increase the rate of entimitation of ArticeP1*. Formal priemacokinetic studies demonstrated that the metabolism of ARICEP1* is not significantly affected by concurrent administration of digoxin or cimetable. *Use with Anticholinergics*: Because of their mechanism of action, cholinesterase inhibitors have the potential to interfere with the activity of anticholinergic medications. *Use with Cholinomimetics and Other Cholinesterase Inhibitors*: A synergistic effect may be expected when cholinesterase inhibitors are given concurrently with succinylcholine, similar neuromuscular blocking agents or cholinergic agonists such as bethanechol. Carcinogenesis, Mutagenesis, Impairment of Fertility No evidence of a of cloimergic agoinsis such as benaleation. Carcinogenics, invalagenesis, impartment or retrinity to evidence carcinogenic potential was obtained in an 88-week carcinogenicity study of donepezil hydrochloride conducted in CD-1 mice at doses up to 180 mg/kg/day (approximately 90 times the maximum recommended human dose on a mg/m² basis). or in a 104-week carcinogenicity study in Sprague-Dawley rats at doses up to 30 mg/kg/day (approximately 30 times the maximum recommended human dose on a mg/m² basis). Donepezil was not mutagenic in the Ames reverse mutation assay in bacteria, or in a mouse lymphoma forward mutation assay in vitro. In the chromosome aberration test in cultures of Chinese hamster lung (CHL) cells, some clastogenic effects ere observed. Donepezil was not clastogenic in the *in vivo* mouse micronucleus test and was not genotoxic in an *in vivo* unscheduled were user voices voice of the program of the activities of the program of the pro to 10 mg/kg/day (approximately 8 times the maximum recommended human dose on a mg/m² basis) from day 17 of gestation through day 20 postpartum, there was a slight increase in still birth sand a slight decrease in pup survival through day 4 postpartum at this dose; the next lower dose tested was 3 mg/kg/day. There are no adequate or well-controlled studies in pregnant women. ARICEPT" should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus. **Nursing Mothers** It is not known whether donepezil is excreted in human breast milk. ARICEPT" has no indication for use in nursing mothers. **Pediatric** Use There are no adequate and well-controlled trials to document the safety and efficacy of ARICEPT® in any illness occurring in children. Geriatric Use Alzheimer's disease is a disorder occurring primarily in individuals over 55 years of age. The mean age of the patients Gertaine Use Additioner's disease is a disorder occurring printantly in individuals over 50 years or age. The internating of the platents enrolled in the clinical studies with ARICEPT" was 73 years; 80% of these patients were between 65 and 84 years old and 49% of the patients were at or above the age of 75. The efficacy and safety data presented in the clinical trials section were obtained from these patients. There were no clinically significant differences in most adverse events reported by patient groups >65 years old and <65 years old. ADVERSE REACTIONS Mild To Moderate Alzheimer's Disease Adverse Events Leading to Discontinuation The rates of discontinuation from controlled clinical trials of ARICEPT" due to adverse events for the ARICEPT" 5 mg/day treatment groups rates of discontinuation from controlled clinical trials of ARICEPI** due to aveverse events for the ARICEPI** mg/day treatment groups at approximately 5%. The rate of discontinuation of patients who received 7-day escalations from 5 mg/day to 10 mg/day, was higher at 13%. The most common adverse events leading to discontinuation, defined as those occurring in at least 2% of patients and at twice the incidence seen in placebo patients, are shown in Table 1. Table 1. Most Frequent Adverse Events Leading to Withdrawal from Controlled Clinical Trials by Dose Group (Placebo, 5 mg/day ARICEPT*, and 10 mg/day ARICEPT*, respectively); Patients Randomized (355, 350, 315); Event/% Discontinuing: Nausea (1%, 1%, 3%); Diarnea (0%, <1%, 3%); Vorniting (<1%, <1%, 2%). Most Frequent Adverse Clinical Events Seen in Association with the Use of ARICEPT*. The most common adverse events, defined as those occurring at a frequency of all east 5% in patients receiving 10 mg/day and twice the placebo rate, are largely predicted by ARICEPT* scholinomimetic effects. These include nausea, diarrhea, insomnia, vomiting, muscle cramp, fatigue and anorexia. These adverse events were often of mild intensity and transient, resolving during continued ARICEPT* treatment without the need for dose modification. There is evidence to suggest that the frequency of these common adverse events may be affected by the rate of titration. An open-label study was conducted with 269 patients who received placebo in the 15 and 30-week studies. These patients were titrated to a dose of 10 mg/day over a 6-week period. The rates of common adverse events were lower than those seen in patients titrated to 10 mg/day over one week 19%, 6%), Diarrha (5%, 6%, 15%, 9%); Insomnia (6%, 6%, 14%, 6%); Faligue (3%, 4%, 8%, 3%); Vomiting (3%, 3%, 8%, 5%); Muscle cramps (2%, 6%, 8%, 3%); Anorexia (2%, 3%, 7%, 3%). Adverse Events Reported in Controlled Trials The events cited reflect experience gained under closely monitored conditions of clinical trials in a highly selected patient population. In actual clinical practice or in other clinical trials, these frequency estimates may not apply, as the conditions of use, reporting behavior, and the kinds controlled and selected patient population. of patients treated may differ. Table 3 lists treatment emergent signs and symptoms that were reported in at least 2% of patients in placebo-controlled trials who received ARICEPT® and for which the rate of occurrence was greater for ARICEPT® assigned than placebo assigned patients. In general, adverse events occurred more frequently in female patients and with advancing age. Table 3. Adverse Events Reported in Controlled Clinical Trials in Mild to Moderate Alzheimer's Disease in at Least 2% of Auverse Evenis Reported in Controlled Childran Frague in Mind to Moderate Aprileminer's Disease in at Lessi 2-year. Patients Receiving ARICEPT" and at a Higher Frequency than Placebo-treated Patients (Body System)/Adverse Event: Placebo [n=355], ARICEPT" (n=747], respectively): Percent of Patients with any Adverse Event: 72, 74. Body Event: Placebo (n=355), ARICEPT "(n=741), respectively): Percent of Patients with any Adverse Event: 72, 74. Body
as a Whole: Headache (9, 10); Pain, various locations (8, 9); Accident (6, 7); Fatigue (3, 5). Cardiovascular System: Syscope
(1, 2). Digestive System: Nausea (6, 11); Diarrhea (5, 10); Vomiting (3, 5); Anorexia (2, 4). Hemic and Lymphatic System:
Ecchymosis (3, 4). Metabolic and Nutritional Systems: Weight Decrease (1, 3). Musculoskeletal System: Muscle Cramps
(2, 6); Arthritis (1, 2). Nervous System: Insomnia (6, 9); Dizziness (6, 8); Depression (<1, 3); Abnormal Dreams (0, 3); Somnolence
(<1, 2). Urogenital System: Frequent Urination (1, 2). Other Adverse Events Observed During Clinical Trials. ARICEPT*
has been administered to over 1700 individuals during clinical trials worldwide. Approximately 1200 of these patients have been deaded for at least 3 months and more than 1000 calcinots by a been treated for at least 3 months and more than 1000 calcinots by a been treated for at least 3 months and more than 1000 calcinots by a been treated for at least 4 months and more than 1000 calcinots by a been treated for a least 6 months. Controlled and uncentrolled trials.

treated for at least 3 months and more than 1000 patients have been treated for at least 6 months. Controlled and uncontrolled trials

in the United States included approximately 900 patients. In regards to the highest dose of 10 mg/day, this population includes 650 patients treated for 3 months, 475 patients treated for 6 months and 116 patients treated for over 1 year. The range of patient exposure is from 1 to 1214 days. Treatment emergent signs and symptoms that occurred during 3 controlled clinical trials and two open-label trials in the United States were recorded as adverse events by the clinical investigators using terminology of their own choosing. To provide an overall estimate of the proportion of individuals having similar types of events, the events were grouped into a smaller number provide a toward summer or reproduction in dividuals rawing similar types or events, the event wave grouped into a shader lateral or standardized categories using a modified COSTART dictionary and event frequencies were calculated across all studies. These categories are used in the listing below. The frequencies represent the proportion of 900 patients from these trials who experienced that event while receiving ARICEPT*. All adverse events occurring at least twice are included, except for those already listed in Tables 2 or 3, COSTART terms too general to be informative, or events less likely to be drug caused. Events are classified by body system and listed using the following definitions: frequent adverse events—those occurring in at least 1/100 patients; infrequent adverse events those occurring in 1/100 to 1/1000 patients. These adverse events are not necessarily related to ARICEPT® treatment and in most cases were observed at a similar frequency in placebo-treated patients in the controlled studies. No important additional adverse events were seen in studies conducted outside the United States. Body as a Whole: Frequent: influenza, chest pain, toothache; Infrequent: fever, edema face, periorbital edema, hernia hiatal, abscess, cellulitis, chills, generalized coldness, head fullness, listlessness. Cardiovascular System: Frequent: hypertension, vasodilation, atrial fibrillation, hot flashes, hypotension; Infrequent: angina pectoris, postural hypotension; myocardial infarction, AV block (first degree), congestive heart failure, arteritis, bradycardia, periphical recently disconsion are unpresentative technological deep visit breads of a formation of the production o vascular disease, supraventricular tachycardia, deep vein thrombosis, Digestive System: Frequent; fecal incontinence vascular disease, supravenincular laditylandia, deep vein infornosis. Digestive System: Prequent: lecal incontinent gastrointestinal bleeding, bloating, epigastric pain; Infrequent: eructation, gingivitis, increased appetile, flatulence, periodontal abscess, choleithiasis, diverticulitis, drooting, dry mouth, fever sore, gastriis, irritable colon, tongue edema, epigastric distress, gastroenteritis, increased transaminases, hemorrhoids, ileus, increased thirst, jaundice, melena, polydipsia, duodenal ulcer, stomach ulcer. Endocrine System: Infrequent: diabetes mellitus, goiter. Hemic and Lymphatic System: Infrequent: anemia, thrombocythemia, thrombocytopenia, eosinophilia, erythrocytopenia. Metabolic and Nutritional Disorders: Frequent: dehydration; Infrequent: gout, hypokalemia, esinicynina, etyinicytopena. Macabine ain waruntuolar Disorbetis. Praquent. berlyotaton, miaregout. System: Frequent bone fracture; Infrequent muscle weakness, muscle tasciculation. Nervous System: Frequent delusions, tremor, irritability, paresthesia, aggression, vertigo, ataxia, increased libido, restlessness, abnormal crying, nervousness, aphasia; Infrequent: cerebrovascular accident, intracranial hemorrhage, transient ischemic attack, emotional lability, neuralgia, coldness (localized), muscle spasm, dysphoria, gait abnormality, hypertonia, hypokinesia, neurodermatitis, numbness (localized), paranoia, dysarthria, dysphasia, hostility, decreased libido, melancholia, emotional withdrawal, nystagmus, pacing. Respiratory System uysadınıa, uyspırasıa, nostiniy, decreased induo, mediciolina, eninduolia wilindawal, iysagınus, pacing. **hespiraduy sysetin.***Frequent: dysprea, sore throat, bronchitis; *Infrequent*: epistaxis, post nasal drip, pneumonia, hyperventialidion, pulmorary congestion, wheezing, hypoxia, pharyngitis, pleurisy, pulmonary collapse, sleep apnea, snorring. **Skin and Appendages:** *Frequent*: pruritus, diaphoresis, urticaria; *Infrequent*: dermatitis, erythema, skin discoloration, hyperkeratosis, alopecia, fungal dermatitis, herpes zoster, hirsutism, skin striae, night sweats, skin ulcer. **Special Senses:** *Frequent*: cataract, eye irritation, vision blurred; *Infrequent*: dry eyes, glaucoma, earache, tinnitus, blepharitis, decreased hearing, retinal hemorrhage, otitis externa, otitis media, bad taste, conjunctival eyes, gauconia, earabre, unmus, peptianis, decreased narning, fendina enrioringe, outse eventa, unus media, babase, conjunitanhemorrhage, ear buzzing, motion sickness, spots before eyes. Urogenital System: Frequent urinary incinience, nocturia; Infrequent: dysuria, hematuria, urinary urgency, metrorrhagia, cystitis, enuresis, prostate hypertrophy, pyelonephritis, inability to empty bladder, breast fibroadenosis, fibrocystic breast, mastitis, pyuria, renal failure, vaginitis. Severe Alzheimer's Diseased Adverse Events Leading to Discontinuation: The rates of discontinuation from controlled clinical trials of ARICEPT" due to adverse events for the ARICEPT" patients were approximately 12% compared to 7% for placebo patients. The most common adverse events leading to discontinuation, defined as those occurring in at least 29% of ARICEPT" patients and at twice the incidence sent placebo patients, were anorexia (2% vs 1% placebo), nausea (2% vs <1% placebo), diarrhea (2% vs 0% placebo), and urinary tract placebo patients, were anorexia (2% to 3 % placebo), nausea (2% to \$<1% placebo), diarrhea (2% to \$% to %) placebo), and urinary tract infection (2% to 1% placebo). Most Frequent Adverse Clinical Events Seen in Association with the Use of ARICEPT* The most common adverse events, defined as those occurring at a frequency of at least 5% in patients receiving ARICEPT* and twice the placebo rate, are largely predicted by ARICEPT* scholinomimetic effects. These include diarrhea, anorexia, vorniting, nausea, and ecchymosis. These adverse events were often of mild intensity and transient, resolving during continued ARICEPT* treatment without the need for dose modification. Adverse Events Reported in Controlled Trials Table 4 lists treatment emergent signs and symptoms that were reported in at least 2% of patients in placebo-controlled trials who received ARICEPT** and or which the rate of occurrence was greater for ARICEPT** assigned than placebo assigned patients. Table 4. Adverse Events Reported in Controlled Clinical Trials in Severe Alzheimer's Disease in at Least 2% of Patients Receiving ARICEPT** and at a Higher Frequency than Placebo-reated Patients (Body System/Adverse Event: Placebo In-agait, ARICEPT* [In=501], respectively): Percent of Patients with any Adverse Event: 73, 81. Body as a Whole: Accident (12, 13), Infection (9, 11); Headache (3, 4); Pain (2, 3); Back Pain (2, 3); Fever (1, 2); Chest Pain (<1, 2). Cardiovascular System (1, 2); Supercent (1, 2); Event (2, 2); Hemorehood (1, 2); Proceed (1, 2); Proceed (2, 3); Proceed (1, 3); Proceed (2, 3); Proceed (2, 3); Proceed (2, 3); Proceed (3, 4); Proceed (3, 4); Proceed (4, 3); Proceed (4, 4); Proceed (4, High Hypertension (2, 3); Hemorrhage (1, 2); Syncope (1, 2); Digestive System: Diarrhea (4, 10); Vomiting (4, 8); Anorexia (4, 8); Nausea (2, 6). Hemic and Lymphatic System: Ecchymosis (2, 5). Metabolic and Nutritional Systems: Creatine Phosphokinase Increased (1, 3); Dehydration (1, 2); Hypertipemia (<1, 2). Nervous System: Insomnia (4, 5); Hostility (2, 3); Nervousness (2, 3); Hallucinations (1, 3); Somnolence (1, 2); Dizziness (1, 2); Depression (1, 2); Confusion (1, 2); Emotional Lability (1, 2); Personality Disorder (1, 2). Skin and Appendages: Eczema (2, 3). Urogenital System: Urinary Incontinence (1, 2). Other Adverse Events Observed During Clinical Trials ARICEPT™ has been administered to over 600 patients with severe Alzheimer's Disease during clinical trials of at least 6 months duration, including 3 double blind placebo controlled trials, one of which had no pen label extension. All adverse events occurring at least twice are included, except for those already listed in Table 4, COSTART terms too general to be informative, or events less likely to be drug caused. Events are classified by body system using the COSTART dictionary and listed using the following definitions: requent adverse events—those occurring in at least 1/100 patients, infrequent adverse events—those occurring in 1/100 to 1/1000 patients. These adverse events are not necessarily related to ARICEPT® treatment and events—unose occurring in 17100 to 171000 patients. These advertse events are not necessarily related to Articce¹⁷ treatment and in most cases were observed at a similar frequency in placebo-treated patients in the controlled studies. **Body as a Whote**: Frequent abdominal pain, asthenia, fungal infection, flu syndrome; Infrequent allergic reaction, cellulitis, malaise, sepsis, favore ederma, hernia. **Cardiovascular System:** Frequent: hypotension, bradycardia, ECG abnormal, heart failure; Infrequent: myocardial infarction, angina pectoris, atrial fibrillation, congestive heart failure, peripheral vascular disorder, supraventricular extrasystoles, cardiomegally. **Digestive System:** Frequent: constipation, gastroenteritis, fecal incontinence, dyspepsia; Infrequent: exactsyones, cardioniegaly. **Digisaries System:**. *Treliqueit*. Consupation, gasticenteins, lear incommentact, vyspepsia, minetigen, against glutamy transpeptidase increase, gastristis, dysphagia, periodonitis, stomach ulcer, periodonital abscess. flatulence, liver function tests abnormal, eructation, esophagitis, rectal hemorrhage. **Endocrine System:** *Infraquent*: diabetes mellitus. **Hemic and Lymphatic System:** *Frequent*:anemia, *Infraquent*:leukocytosis. **Metabolic and Nutritional Disorders:** *Frequent*:weight loss, peripheral edema, edema, lactic dehydrogenase increased, alkaline phosphatase increased; *Infraquent*: hypercholestermia, hypokalemia, hypoglycemia, weight gain, bilitubinemia, BUN increased, B., deficiency anemia, cachexia, creatinine increased, gout, hyponatermia, hypogroteinemia, iron deficiency anemia, SGOT increased, SSPT increased. **Musculoskeletat System:** *Frequent*: *Historia for anemia*, and a secondary anemia, and a secondary anemia and a secondary hyponatemia, hypoproteinemia, iron deficiency anemia, SGOT increased, SGPT increased. Musculoskeletal System: Frequent: arthritis, Infrequent: arthrosis, bone fracture, arthritiga, leg cramps, osteoporosis, myalgia. Nervous System: Frequent antivity, infrequent: antivity, termor, convulsion, wandering, abnormal gait; Infrequent: apathy, vertigo, delusions, abnormal dreams, cerebrovasous accident, increased salivation, wandering, abnormal gait; Infrequent: apathy, vertigo, delusions, abnormal dreams, cerebrovasous accident, increased salivation, ataxia, euphoria, vasodilatation, cerebral hemorrhage, cerebral Infarction, cerebral ischemia, dementia, extrapyramidal syndrome, grand mal convulsion, hemiplegia, hypertonia, hypokinesia. Respiratory System: Frequent: phanyngitis, pneumonia, cough increased, bronchitis; Infrequent: dyspena, thinitis, asthma. Skin and Appendages: Frequent: rash, skin utic, pnuritus; Infrequent: psariasis, skin discoloration, herpes zoster, dry skin, sweating, urticaria, vesiculobullous rash. Special Senses: Infrequent: conjunctivitis, glaucoma, abnormal vision, ear pain, lacrimation disorder. Urogenital System: Frequent urinary tract infection, cystitis, hematuria, glycosuria; Infrequent: vaginitis, dysuria, urinary frequency, albuminuria. Postintroduction Reports Voluntary reports of adverse events temporally associated with ARICEPT" that have been received since market introduction that are not listed above, and that there is inadequate data to determine the causal relationship with the drug include the following: abdominal pain, agitation, choleystitis, confusion, convulsions, hallucirations, heart block (all types), hemolytic anemia, hepatitis, hyponatremia, pain, agitation, cholecystitis, confusion, convulsions, hallucinations, heart block (all types), hemolytic anemia, hepatitis, hyponatremia neuroleptic malignant syndrome, pancreatitis, and rash, OVERDOSAGE Because strategies for the management of neuroleptic malignant syndrome, pancreatitis, and rash. **OVEHDUSAGE Because** strategies for the management of voverdose are continually evolving, it is advisable to contact a Poisson Control Center to determine the latest **recommendations** for the management of an **overdose** of any drug. As in any case of overdose, general supportive measures should be utilized. Overdosage with cholinesterase inhibitors can result in cholinergic crisis characterized by severe nausea, ovniting, salivation, sweating, bradycardia, hypotension, respiratory depression, collapse and convulsions. Increasing muscle weakness is a possibility and may result in death if respiratory muscles are involved. Tertiary anticholinergics such as atropine may be used as an antichole for ARICEPT® overdosage. Intravenous atropine sulfate threated to effect is recommended; an initial close of 1.0 be used as an annoted in Anticer 1 over obsequent masked upon clinical response. Alypical responses in blood pressure and heart rate have been reported with other cholinomimetics when co-administered with quaternary anticholinergics such as glycopyrrolate. It is not known whether ARICEPT* and/or its metabolites can be removed by dialysis (hemodialysis, peritoneal dialysis, or hemofiltration). Dose-related signs of toxicity in animals included reduced spontaneous movement, prone position, staggering gait, lacrimation, clonic convulsions, depressed respiration, salivation, miosis, tremors, fasciculation and lower body surface temperature.
