Time to Shutter Low-Volume Transplant Centers?

BY BRUCE JANCIN

SNOWMASS, COLO. — The number of U.S. heart transplant centers needs to be cut by about two-thirds.

With more than 140 heart transplant programs now in place in the United States, relatively few centers have a reasonable case volume. In fact, the number of high-volume centers is actually declining as centers compete for the extremely

limited number of donor organs, according to Dr. Bruce W. Lytle, professor and chair of cardiothoracic surgery at the Cleveland Clinic Foundation.

It's a situation that cries out for national regulation, Dr. Lytle said at a conference sponsored by the American College of Cardiology. "Organ allocation and utilization would probably be a lot more efficient under those circumstances, the surgeon said.

International Society for Heart and Lung Transplantation (ISHLT) data show that 30-day mortality is doubled at cardiac transplant centers performing fewer than 10 procedures per year. Of all U.S. centers, 45% consistently do fewer than 10 procedures annually, and during a recent 8-year period fully 66% of centers failed to reach the 10-case mark in all 8 years (Ann. Thorac. Surg. 2008;86:1250-9).

Survival 5 years post transplant is cur-

The pharmacokinetics of diltiazem is not affected by ranolazine in healthy volunteers receiving diltiazem 60 mg three times daily and Ranexa 1000 mg twice daily

Drugs Transported by P-gp Ranexa (1000 mg twice daily) causes a 1.5-fold elevation of digoxin

plasma concentrations. The dose of digoxin may have to be adjusted Drugs Metabolized by CYP2D6 Ranolazine or its metabolites partially inhibit CYP2D6. There are no studies of concomitant use of Ranexa with other drugs metabolized by CYP2D6, such as tricyclic antidepressants and antipsychotics,

but lower doses of CYP2D6 substrates may be required.

8. USE IN SPECIFIC POPULATIONS

8.1 Pregnancy—Pregnancy Category C: In animal studies regulary regulary category category of in animal studies, ranolazine at exposures 1.5 (rabbit) to 2 (rat) times the usual human exposure caused maternal toxicity and misshapen sternebrae and reduced ossification in offspring. These doses in rats and rabbits were associated with an increased maternal mortality rate. There are no adequate well-controlled studies in pregnant women Ranexa should be used during pregnancy only when the potential benefit to the patient justifies the potential risk to the fetus.

8.3 Nursing Mothers: It is not known whether ranolazine is excreted in human milk. Because many drugs are excreted in human milk and because of the potential for serious adverse reactions from ranolazine in nursing infants, decide whether to discontinue nursing or to discontinue Ranexa, taking into account the importance of the does to the number of the series of drug to the mother.

8.4 Pediatric Use: Safety and effectiveness have not been estab ished in pediatric patients

8.5 Geriatric Use: Of the chronic angina patients treated with Ranexa in controlled studies, 496 (48%) were ≥ 65 years of age, and 114 (11%) were \geq 75 years of age. No overall differences in efficacy were observed between older and younger patients. There were no differences in safety for patients \geq 65 years compared to younger patients, but patients \geq 75 years of age on ranolazine, compared to placebo, had a higher incidence of adverse events, serious adverse events, and drug discontinuations due to adverse events, serious adverse events, and drug discontinuations due to adverse events. In general, dose selection for an elderly patient should usually start at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease, or other drug therapy.

8.6 Use in Patients with Hepatic Impairment: Ranexa is 8.6 Use in Patients with Hepatic Impairment: Nanexa is contraindicated in patients with clinically significant hepatic impair-ment. Plasma concentrations of ranolazine were increased by 30% in patients with mild (Child-Pugh Class A) and by 60% in patients with moderate (Child-Pugh Class B) hepatic impairment. This was not enough to account for the 3-fold increase in QT prolongation seen in patients with mild to severe hepatic impairmet traindications (4)]. nt Isee Con

8.7 Use in Patients with Renal Impairment: In patients with varying degrees of renal impairment, ranolazine plasma levels increased up to 50%. The pharmacokinetics of ranolazine has not been assessed in patients on dialysis.

8.8 Use in Patients with Heart Failure: Heart failure (NYHA Class I to IV) had no significant effect on ranolazine pharmacoki-netics. Ranexa had minimal effects on heart rate and blood pres-sure in patients with angina and heart failure NYHA Class I to IV No dose adjustment of Ranexa is required in patients with heart failure

8.9 Use in Patients with Diabetes Mellitus: A population pharmacokinetic evaluation of data from angina patients and healthy subjects showed no offect of diabetes on ranolazine pharmacokinetics. No dose adjustment is required in patients with diabetes.

Ranexa produces small reductions in HbA1c in patients with diabetes the clinical significance of which is unknown. Ranexa should not be

10. OVERDOSAGE

considered a treatment for diabetes.

High oral doses of ranolazine produce dose-related increases in dizziness, nausea, and vomiting. High intravenous exposure also produces diplopia, paresthesia, confusion, and syncope. In addition to general supportive measures, continuous ECG monitoring may be warranted in the event of overdose.

Since ranolazine is about 62% bound to plasma proteins, hemodi-alysis is unlikely to be effective in clearing ranolazine.

rently about 80%, with superb quality of life. "Cardiac transplantation is really one of the great operations of all time, particularly in this day and age, now that a lot of the immune suppression

Thirty-day mortality doubles in centers that perform fewer than 10 transplants a year.

DR. LYTLE

problems have been dealt with," he said. However, from a public health perspective cardiac transplantation is relatively ineffective, Dr. Lytle added. Although an estimated 250,000-300,000 Americans under age 75 have class IIIb/IV heart failure and are thus potential candidates for cardiac replacement therapy, the limited donor organ supply means only about 3,000 transplants can be done annually. Mechanical replacement using left ventricular assist devices as destination therapy will have a much greater impact in this population than will organ transplantation, he predicted. Dr. Lytle reported no relevant financial

interests.

CABG Star Ratings to Be Published

FORT LAUDERDALE, FLA. — Later this year, a one- to three-star rating system for cardiac surgeons developed by the Society for Thoracic Surgeons will appear on a Consumer Reports Web site.

The society teamed with the Consumers Union, publisher of Consumer Reports, to disseminate rankings of U.S. programs offering coronary artery bypass grafting (CABG). The ranking data comes from the Society of Thoracic Surgeons' (STS) Adult Cardiac Surgery Database, which currently gathers surgery and outcomes data from about 90% of practicing U.S. cardiac surgeons. The ranking will post at www.consumer reports.org/health, said Dr. Frederick L. Grover, chairman of the STS' council on quality, research, and patient safety.

Each participating practice will receive star ratings in five categories: overall CABG performance, patient survival, avoidance of complications, the extent to which the CABG program follows recommended surgical practice, and the extent of following recommended medications. Performance of each practice in these categories is risk-adjusted, assessed as a ratio of observed relative to expected performance, and ranked relative to all other practices, said Dr. Grover, professor and chairman of surgery at the University of Colorado, Denver.

Ranexa RANOLAZINE EXTENDED-RELEASE TABLETS 500 mg · 1000 mg

Brief Summary of Prescribing Information

These highlights do not include all the information needed to use Ranexa safely and effectively. See full prescribing information for Ranexa

Ranexa (ranolazine) extended-release tablets

1. INDICATIONS AND USAGE Ranexa is indicated for the treatment of chronic angina

Ranexa may be used with beta-blockers, nitrates, calcium channel blockers, anti-platelet therapy, lipid-lowering therapy, ACE inhibitors, and angiotensin receptor blockers. 2. DOSAGE AND ADMINISTRATION

2.1 Dosing Information

Thitate Ranexa dosing at 500 mg twice daily and increase to 1000 mg twice daily, as needed, based on clinical symptoms. Take Ranexa with or without meals. Swallow Ranexa tablets whole; do not crush, break, or chew. The maximum recommended daily dose of Ranexa is 1000 mg

twice daily. If a dose of Ranexa is missed, take the prescribed dose at the next

2.2 Dose Modification

Dose adjustments may be needed when Ranexa is taken in com-bination with certain other drugs *[see Drug Interactions (7.1)]*. Limit the maximum dose of Ranexa to 500 mg twice daily in patients on diltiazem, verapamil, and other moderate CYP3A inhibitors. Downtitrate Ranexa based on clinical response in patients concomitantly treated with P-gp inhibitors, such as cyclosporine.

3. DOSAGE FORMS AND STRENGTHS

scheduled time; do not double the next dose

Ranexa is supplied as film-coated, oblong-shaped, extended-release tablets in the following strengths:
500 mg tablets are light orange, with GSI500 on one side
1000 mg tablets are pale yellow, with GSI1000 on one side

4. CONTRAINDICATIONS

Taking strong inhibitors of CYP3A [see Drug Interactions (7.1)]
 Taking inducers of CYP3A [see Drug Interactions (7.1)]

• With clinically significant hepatic impairment [see Use in Specific Populations (8.6)]

5. WARNINGS AND PRECAUTIONS

5.1 QT Interval Prolongation: Ranolazine blocks I_{kr} and prolongs the QTc interval in a dose-related manner.

Clinical experience in an acute coronary syndrome population did not show an increased risk of proarrhy thmia or sudden death. How-ever, there is little experience with high doses (> 1000 mg twice daily) or exposure, other QT-prolonging drugs, or potassium channel variants resulting in a long QT interval.

6. ADVERSE REACTIONS

6.1 Clinical Trial Experience: Because clinical trials are con-ducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

A total of 2.018 patients with chronic angina were treated with ranolazine in controlled clinical trials. Of the patients treated with Ranexa, 1,026 were enrolled in three double-blind, placebo-controlled, randomized studies (CARISA, ERICA, MARISA) of up to 12 weeks duration. In addition, upon study completion, 1,251 patients received treatment with Ranexa in open-label, long-term studies 1,227 patients were exposed to Ranexa for more than 1 year, 613 patients for more than 2 years, 531 patients for more than 3 years, and 326 patients for more than 4 years.

At recommended doses, about 6% of patients discontinued treatment with Ranexa because of an adverse event in controlled studies in angina patients compared to about 3% on placebo. The most common adverse events that led to discontinuation more frequently on Ranexa Wersus 0%). Doses above 1000 mg twice daily are poorly tolerated.

reported treatment-emergent adverse reactions (> 4% and more common on Ranexa than on placebo) were dizziness (6.2%), head-ache (5.5%), constipation (4.5%), and nausea (4.4%). Dizziness may be dose-related. In open-label, long-term treatment studies, a similar drivere ordering and/its was absorved. adverse reaction profile was observed. The following additional adverse reactions occurred at an incidence

In controlled clinical trials of angina patients, the most frequently

of 0.5 to 2.0% in patients treated with Ranexa and were more frequent than the incidence observed in placebo-treated patients: Cardiac Disorders - bradycardia, palpitations

Ear and Labyrinth Disorders - tinnitus, vertigo

Gastrointestinal Disorders - abdominal pain, dry mouth, vomiting General Disorders and Administrative Site Adverse Events peripheral edema

Respiratory, Thoracic, and Mediastinal Disorders - dyspnea Vascular Disorders - hypotension, orthostatic hypotension

Other (< 0.5%) but potentially medically important adverse reactions observed more frequently with Ranexa than placebo treatment in all controlled studies included: angioedema, renal failure, eosinophilia, blurred vision, confusional state, hematuria, hypoesthesia, paresthesia, tremor, pulmonary fibrosis, thrombocytopenia, leukopenia, and concutences. pancytopenia.

A large clinical trial in acute coronary syndrome patients was unsuccessful in demonstrating a benefit for Ranexa, but there was no apparent proarrhythmic effect in these high-risk patients

Laboratory Abnormalities Ranexa produces small reductions in hemoglobin A1c. Ranexa is not a treatment for diabetes.

Ranexa produces elevations of serum creatinine by 0.1 mg/dL, regardless of previous renal function. The elevation has a rapid onset, shows no signs of progression during long-term therapy, is thereby, shows he signs of projection diarbay, its reversible after discontinuation of Ranexa, and is not accompanied by changes in BUN. In healthy volunteers, Ranexa 1000 mg twice daily had no effect upon the glomerular filtration rate. The elevated creatinine levels are likely due to a blockage of creatinine's tubular coertient burgelaring are of the method these. secretion by ranolazine or one of its metabolites.

7. DRUG INTERACTIONS

7.1 Effects of Other Drugs on Ranolazine: Ranolazine is primarily metabolized by CYP3A and is a substrate of P-glycoprotein (P-gp). CYP3A Inhibitors

Do not use Ranexa with strong CYP3A inhibitors, including keto-conazole, itraconazole, clarithromycin, nefazodone, nelfinavir, rito-navir, indinavir, and saquinavir. Ketoconazole (200 mg twice daily) es average steady-state plasma concentrations of ranolazine 3.2-fold [see Contraindications (4)].

Limit the dose of Ranexa to 500 mg twice daily in patients on moderate CYP3A inhibitors, including diltiazem, verapamil, aprepitant, eryth-romycin, fluconazole, and grapefruit juice or grapefruit-containing products. Diltiazem (180–360 mg daily) and verapamil (120 mg three times daily) increase ranolazine steady-state plasma concen-tratione theory of the Grane and deliviteting (2014) trations about 2-fold [see Dosage and Administration (2.2)].

Weak CYP3A inhibitors such as simvastatin (20 mg once daily) and cimetidine (400 mg three times daily) do not increase the exposure to ranolazine in healthy volunteers

P-gp Inhibitors

Down-titrate Ranexa based on clinical response in patients concomit antly treated with P-gp inhibitors, such as cyclosporine [see Dosage and Administration (2.2)].

CYP3A and P-gp Inducers Avoid co-administration of Ranexa and CYP3A inducers such as rifampin, rifabutin, rifapentin, phenobarbital, phenytoin, carbamazepine, and SL John's work. Rifampin (600 mg once daily) decreases the plasma concentration of ranolazine (1000 mg twice daily) by approximately 95% by induction of CYP3A and, probably, P-gp.

CYP2D6 Inhibitors

The potent CYP2D6 inhibitor, paroxetine (20 mg once daily), increases ranolazine concentrations 1.2-fold. No dose adjustment of Ranexa is required in patients treated with CYP2D6 inhibitors.

Digoxin Digoxin (0.125 mg) does not significantly alter ranolazine levels.

7.2 Effects of Ranolazine on Other Drugs: In vitro studies indicate that ranolazine and its O-demethylated metabolite are weak

inhibitors of CYP3A, moderate inhibitors of CYP2D6 and moderate P-gp inhibitors. Ranolazine and its most abundant metabolites are not known to inhibit the metabolism of substrates for CYP 1A2, 2C8, 2C9, 2C19, or 2E1 in human liver microsomes, suggesting that ranolazine is unlikely to alter the pharmacokinetics of drugs metabolized by these enzymes.

Drugs Metabolized by CYP3A The plasma levels of simvastatin, a CYP3A substrate, and its active metabolite are each increased about 2-fold in healthy subjects receiving simvastatin (80 mg once daily) and Ranexa (1000 mg twice daily). Dose adjustments of simvastatin are not required when Ranexa is co-administered with simvastatin
