**Opinion** PEDIATRIC NEWS • August 2007

# LETTERS FROM MAINE The Right Stuff

ne of the perks that maturing physician can enjoy is a defreclining quency of unexpected clinical out-

comes. As the face-to-face patient encounters accumulate over the years, recally, while the older physician notices that his memory for specifics is declining, he may find himself saying more often, "I've seen something like this before."

In fact, if he can remain objective and engaged with the passing multitude, the experienced physician may develop diagnostic skills that can make him appear psychic. Many years ago I remember being in awe of one of our older physicians who

peating patterns begin to emerge. Ironi- could arrive at the correct diagnosis in half the time and usually with none of the lab or x-ray studies that his young associates required. In addition, his therapeutic interventions seemed to fail far less often than mine.

> Sadly, I haven't come close to achieving that old guy's uncanny diagnostic skills, but I've been seeing patients long enough to appreciate how easy things are when my experience includes the right stuff.

> > Menomune-A/C/Y/W-135 vaccine

And, how uncomfortable I feel when I am clueless and floundering even after taking a thorough history and physical.

There is no substitute for an accurate diagnosis or the correct answer to a parent's question. The wrong path can trigger an expensive and time-consuming cascade of lab tests, x-rays, and poorly focused consultations. Therapeutic interventions may be recommended that are likely to be ineffective or, worse yet, that tip their own domino slide of side effects and confusing symptoms.

For example, let's take the everyday scenario of the 18-month-old who is in the middle of the community-wide viral gastroenteritis. Her vomiting has subsided after 2 days but the diarrhea is still voluminous. Her physician does a thorough exam including a weight. He determines that there is no immediate danger of dehydration and suggests that the family continue the oral electrolyte solution and suggests a "bland diet." Unfortunately, the physician fails to ask what the family is currently giving the child to eat and drink.

The parents, believing that the oral electrolyte solution is a medication, continue to give the child fruit juice as her primary beverage in addition to the solution. The diarrhea continues to rage and 2 days later the family returns to the emergency department after hours. The ED physician orders a battery of tests including stool cultures and a survey for intestinal parasites. The bill for the hospital services exceeds \$400. And, when the family finally returns to the pediatrician, the child's bottom is raw and bleeding.

It is tempting to blame the parents for not considering that if the pediatrician had previously recommended fruit juice as a remedy for constipation, then juice would probably be a bad idea when the child has diarrhea. However, I have witnessed the scenario enough times to remove this from my list of basic assumptions. After several unfortunate experiences, I now ask all parents exactly what they are giving their children now and I specify what they should and should not give their children until the diarrhea subsides.

So what's the big deal? In the whole spectrum of medical mistakes, this physician's omission is so trivial that it will never appear as a statistic. But, it does make me shiver to think how big the iceberg of medical errors must be.

The dilemma I struggle with occurs when I am eavesdropping and I hear what I know is the wrong answer being given to a parent. Of course, when the error may result in pain or injury, I speak up promptly. However, when the fallout of the imperfect advice will be limited to a loss of time or money, I bite my tongue. And, I hope I will remember at some later time to tactfully discuss the scenario. The problem is that neither tact nor memory is my strong suit. I don't want to be seen as a nitpicking old codger ... all the time.

## Meningococcal (Groups A, C, Y and W-135) **Polysaccharide Diphtheria Toxoid Conjugate Vaccine** Menactra®

FOR INTRAMUSCULAR INJECTION

Brief Summary: Please consult package insert for full prescribing information.

NDICATIONS AND USAGE

Memoratry accoins is indicated for active immunization of adolescents and adults 11–55 years of age for the prevention of invasive meningococcal disease caused by Neisseria meningitidis serogroups A, C, Y and W-135.

Menactra vaccine is not indicated for the prevention of meningitis caused by other microorganisms or for the prevention of invasive meningococcal disease caused by *N meningitidis* serogroup B.

Menactra vaccine is not indicated for treatment of meningococcal infections.

Menactra vaccine is not indicated for immunization against diphtheria.

The Advisory Committee on Immunization Practices (ACIP) has published recommendations for the prevention and control of mening coccal disease in the US (refer to www.cdc.gov). 1

As with any vaccine, Menactra vaccine may not protect 100% of individuals.

CONTRAINDICATIONS

Known hypersensitivity to any component of Menactra vaccine including diphtheria toxoid, or a life-threatening reaction after previous administration of a vaccine containing similar components,? are contraindications to vaccine administration.

Known history of Guillain-Barré Syndrome (see WARNINGS section) is a contraindication to vaccine administration.

ensitivity to dry natural rubber latex (see WARNINGS section) is a contraindication to vaccine administration

Guillain-Barré Syndrome (GBS) has been reported in temporal relationship following administration of Menactra vaccine (see ADVERSE REACTIONS, POST-MARKETING REPORTS section). Persons previously diagnosed with GBS should not receive Menactra vaccine. The stopper of the vial contains dry natural rubber latex, which may cause allergic reactions in latex-sensitive individuals.

Because of the risk of hemorrhage, Menactra vaccine should not be given to persons with any bleeding disorder, such as he or thrombocytopenia, or to persons on anticoagulant therapy unless the potential benefit clearly outweighs the risk of admin if the decision is made to administer Menactra vaccine in such persons, it should be given with caution, with steps taken to risk of bleeding or hematoma formation following injection.

The ACIP has published guidelines for vaccination of persons with recent or acute illness (refer to www.cdc.gov).3

The Autr has purposed.

PRECAUTIONS
GENERAL
Before administration, all appropriate precautions should be taken to prevent adverse reactions. This includes a review of the patient's previous immunization history, the presence of any contrandications to immunization, the current health status, and history concerning possible sensitivity to the vaccine, similar vaccine, or to latex.

PROPRIED TO STATE OF THE PROPRIED TO

As part of the patient's immunization record, the date, lot number and manufacturer of the vaccine administered should be rec Special care should be taken to avoid injecting the vaccine subcutaneously since clinical studies have not been conducted to estab-lish safety and efficacy of the vaccine using this route of administration.

A separate, sterile syringe and needle or a sterile disposable unit should be used for each patient to prevent transmission of blood borne infectious agents from person to person. Needles should not be recapped and should be disposed of according to biohazardous waste guidelines.

The immune response to Menactra vaccine administered to immunosuppressed persons has not been studied

The immune response to Menactra vaccine administered to immunosuppressed persons has not been studied.

NIFORMATION FOR PATIENTS

Prior to administration of Menactra vaccine, the health-care professional should inform the patient, parent, guardian, or other responsible adult of the potential benefits and risks to the patient, and provide vaccine information statements (see ADVERSE REACTIONS and WARNINGS sections). Patients, parents or guardians should be instructed to report any suspected adverse reactions to their health-care professional. Females of childbearing potential should be informed that Sanofi Pasteur inc. maintains a pregnancy registry to monitor letal outcomes of pregnant women exposed to Menactra vaccine. If they are pregnant or become aware they were pregnant at the time of Menactra vaccine immunization, they should contact their health-care professional or Sanofi Pasteur inc. at 1-500-522-2486 (see PRECAUTIONS section).

For information regarding concomitant administration of Menactra vaccine with other vaccines, refer to ADVERSE REACTIONS and DOSAGE AND ADMINISTRATION sections

Immunosuppressive therapies, including irradiation, antimetabolites, alkylating agents, cytotoxic drugs, and corticosteroids (used in greater than physiologic doses) may reduce the immune response to vaccines.

CARCINGENESIS, MUTAGENESIS, IMPAIRMENT OF FERTILITY
Menactra vaccine has not been evaluated in animals for its carcinogenic or mutagenic potentials or for impairment of fertility.

Menactra vaccine has not been evaluated in animals for its carcinogenic or mutagenic potentials or for impairment of refutity. PREGNANCY CATECROPY C
Animal reproduction studies were performed in mice using 0.2 mL of Menactra vaccine (900 times the human dose, adjusted by body weight). There were no effects on fertility, maternal health, embryo/fetal survival, or post-natal development. Skeletal examinations revealed on fettils (of 0.249 examined) in the vaccine group with a cleft patiet. None were observed in the concurrent control group (0 of 174 examined). There are no data that suggest that this isolated finding is vaccine related, and no other skeletal and organ malformations were observed in this study. There are no adequate and well-controlled studies in pregnant women. Because animal studies are not always predictive of human response, Menactra vaccine should be used during pregnancy only if clearly needed. Health-care providers are encouraged to register pregnant women who receive Menactra vaccine in Sanofi Pasteur Inc.'s vaccination pregnancy registry by calling 1-800-822-2463.

NURSING MOTHERS
It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when Menactra vaccine is administered to a nursing woman.

GERIATRIC USE SAFETY AND EFFECTIVENESS OF MENACTRA VACCINE IN ADULTS OLDER THAN 55 YEARS HAVE NOT BEEN ESTABLISHED.

ADVERSE REACTIONS
The safety of Menactra vaccine was evaluated in 6 clinical studies that enrolled 7642 participants aged 11–55 years who received Menactra vaccine and 3041 participants who received Menactra vaccine and 3041 participants who received Menactra vaccine recipients of all ages, 21.3%, 53.2% and 25.5% were in the 11–14, 15–25 and 25–55-year age groups, respectively. Among Menonune—A/CV/W-135 vaccine recipients of all ages, 21.3%, 53.2% and 25.5% were in the 11–14, 15–25 and 26–55-year age groups, respectively. Among Menonune—A/CV/W-135 vaccine recipients of all ages, 16.1%, 51.9% and 32.0% were in the 11–14, 15–25 and 26–55-year age groups, respectively. The two primary safety studies were randomized, active-controlled trials that enrolled participants 11–18 years of age (Menactra vaccine, N=2270; Menonune—A/CV/W-135 vaccine, N=972) and 18–55 years of age (Menactra vaccine, N=2270; Menonune—A/CV/W-135 vaccine, N=972) and 18–55 years of age (Menactra vaccine, N=2270; Menonune—A/CV/W-135 vaccine and vaccine year intranuscularly, Menonune—A/CV/W-135 quives usubcutaneously), study personnel collecting the safety data differed from personnel administering the vaccine. Solicited local and systemic reactions were monitored daily for 7 days post-vaccination using a diary card. Participants were monitored for 28 days for unsolicited adverse events and for 6 months post-vaccination visits to an emergency rown, unexpected visits to an office physician, and serious adverse events fundation using a characteristic physician was developed in the period was obtained via a scripted telephone interview. At least 94% protipionals from the two studies completed the 6-month follow-up evaluation.

In the two concomitant vaccination studies with Menactra and either Typhim Vio rTd vaccines, local and systemic adverse event intervely and the two studies completed the 6-month follow-up evaluation.

Serious adverse events reported within a 6-month time period tollowing vaccination occurred at the same rate (1.579) in the menature vaccine and Menomune—ACV/M-135 vaccine groups. The events reported were consistent with events experted in healthy adolescent and adult populations.

SOLICITED ADVERSE EVENTS IN THE PRIMARY SAFETY STUDIES
The most commonly reported solicited adverse reactions in adolescents, ages 11–18 years (TABLE 1), and adults, ages 18–55 years (TABLE 2), were local pain, headache and fatigue. Except for redness in adults, local reactions were more frequently reported after Menanture—ACV/M-135 vaccination. The majority of local and systemic reactions following Menactica vaccination than after Menoniume—ACV/M-135 vaccination were reported as mild in intensity. No important differences in rates of malaise, diadrinea, anorexis, vomitting, or rask were observed between the vaccine groups.

### TABLE 1: PERCENTAGE OF PARTICIPANTS 11–18 YEARS OF AGE REPORTING SOLICITED REACTION

Reaction	Any	Moderate	Severe	Any	Moderate	Severe

arm; § Severe: Requiring bed rest, □ Severe: ≥5 episodes; ¹ Severe: skipped ≥3 meals; ፆ Severe: ≥40.0°C; \*\* Severe: ≥3 episodes;

¹¹ These solicited adverse events were reported as present or absent only.

†† These solicited adverse events were reported as present or absent only. ADVERSE EVENTS in CONCOMTANT VACCINE STUDIES Local and Systemic reactions when given with Td vaccine the two vaccine groups reported similar frequencies of local pain, induration, redness and swelling at the Menactra injection swell as, at the Td injection site. Pain was the most frequent local reaction reported at both the Menactra and Td injection sites yearlicipants experienced pain after Td vaccination than after Menactra vaccination (71% versus 53%). The majority (6a). Participants experienced pain after Td vaccination than after Menactra vaccination (71% versus 53%). The majority (6a). The participants experienced pain after Td vaccination than after Menactra vaccination (71% versus 53%). The majority (6a) to the participant of t

The overall rate of systemic adverse events was higher when Menactra and Td vaccines were given concomitantly than when Menactra vaccine was administered 28 days after Td. In both groups, the most common reactions were headache (Menactra vaccine + Td. 36%; Td + Placebo, 34%; Menactra vaccine alone, 22%) and fatigue (Menactra vaccine + Td. 32%; Td + Placebo, 29%, Menactra vaccine alone, 17%). No important differences in rates of malaise, diarrhea, anorexia, vomiting, or ash were observed between the groups. Fever ≥40.0°C occurred at ≤0.5% in all groups. No seizures occurred in either group.

between the groups. Fever ≥40.0°C occurred at ≤0.5% in all groups. No seizures occurred in either group.

Local and Systemic Reactions when Given with Typhim VI Vaccine
The two vaccine groups reported similar frequencies of local pain, induration, redness and swelling at the Menactra injection site, as
well as, at the Typhim VI injection site. Pain was the most frequent local reaction reported at both the Menactra and Typhim VI injection sites. More participants experienced pain after Typhim VI vaccination than after Menactra vaccination (76% versus 47%). The
majority (70%-77%) of local solicited reactions for both groups at either injection site were reported as mild and resolved within 3
days post-vaccination. In both groups, the most common systemic reaction was headache (Menactra + Typhim VI vaccine, 41%;
Typhim VI vaccine + Placebo, 42%; Menactra vaccine alone, 23%) and fatigue (Menactra + Typhim VI vaccine, 38%; Typhim VI vaccine + Placebo, 45%; Menactra vaccine alone, 27%). No important differences in rates of malaise, diarrhea, anorexia, vomiting, or rash
were observed between the groups. Fever ≥40.0°C and seizures were not reported in either group.

POST-MARKETING REPORTS
The following adverse events have been reported during post-approval use of Menactra vaccine. Because these events were reported voluntarily from a population of uncertain size, it is not always possible to reliably calculate their frequency or to establish a causal relationship to Menactra vaccine exposure.

Nervous system disorders - Guillain-Barré Syndrome, transverse myelitis

NetWood System usdocroe's Contain Action (State of the Contain Contain

Do not administer this product intravenously, subcutaneously, or intradermally.

The need for, or timing of, a booster dose of Menactra vaccine has not yet been determined.

Parenteral drug products should be inspected visually for container integrity, particulate matter and discoloration prior to administration, whenever solution and container permit.

uun, wnenever soutton and container permit.

CONCOMITANT ADMINISTRATION WITH OTHER VACCINES
Safety and immunogenicity data are available on concomitant administration of Menactra vaccine with Typhim Vi, and Td vaccines
(see ADVERSE REACTIONS section). Concomitant administration of Menactra vaccine with Td did not result in reduced tetanus, diphtheria or meningococcal antibody responses compared with Menactra vaccine administered 28 days after Td. However, for meningooccal sergoroups C, Y and W-135, bactericidial antibody titers (GMTs) and the proportion of participants with a 4-fold or greater rise
in Serum Bactericidal Assay (SBA) using baby rabbit complement (SBA-BR) titer were higher when Menactra vaccine was given concomitantly with Td than when Menactra vaccine was given one month following Td. The clinical relevance of these findings has not
been fully evaluated.<sup>4</sup>

Concomitant administration of Menactra vaccine with Typhim Vi vaccine did not result in reduced antibody responses to any of the vaccine antigens.4

The safety and immunogenicity of concomitant administration of Menactra vaccine with vaccines other than Typhim Vi or Td vaccines have not been determined.

Menactra vaccine must not be mixed with any vaccine in the same syringe. Therefore, separate injection sites and different syringes should be used in case of concomitant administration.

STURAGE
Store between 2° to 8°C (35° to 46°F). DO NOT FREEZE. Product that has been exposed to freezing should not be used. Protect fron light. Do not use after expiration date.
