

Specialties Are Feeling the Recession's Pinch

BY ERIK GOLDMAN

DENVER — Multispecialty group practice revenue dropped last year for the first time in a decade as practices across the country felt the impact of the recession, but primary care revenue appears relatively healthy.

The Medical Group Management Association's cost survey for 2009 showed a 1.9% decline in mean total medical gross revenue among multispecialty groups, as well as a 9.9% drop in volume of medical procedures (indicated by relative value units [RVUs] provided per patient) and an 11% decrease in total patient volume. Not surprisingly, bad debt from fee-for-service charges increased by 13%.

The 2009 report, released at the MGMA's annual conference, was based on 2008 data and so represents a snapshot of the early phase of the recession.

Hardest hit by the economic downturn have been gastroenterologists, with a 5% drop in revenue. In general, the procedure-based specialties are feeling the hardest squeeze.

Current conditions could be a significantly worse, but won't likely show up until the next survey, said Dr. William F. Jessee, president and chief executive officer of MGMA, who presented the data.

Though fully one-third of practices surveyed reported a decrease in total revenue in 2008, the news wasn't all bad. Data on single-specialty groups showed some clear winners, even in these hard times. In particular, cardiologists reported a 7.9% mean increase in total revenue after operating costs. Pediatricians topped that, with a 9% increase. Family physicians reported a 2.4% mean increase.

Hardest hit were gastroenterologists, with a 5% drop in revenue. In general, the procedure-based specialties are feeling the hardest squeeze, Dr. Jessee commented.

Still, even in the sectors that have seen increases, the percentage increase in gross revenue is only a few points higher than the rising costs of staying in practice, if that much. Many practices, especially the smaller ones, are struggling.

Dr. Jessee said that group practices are tightening their belts.

On average, practices reported reducing support staff costs by 1.5%, though there were no reported significant changes in number of staff members. That means only one thing: Many employees have taken pay cuts. In some cases, the doctors themselves are taking home less pay, he pointed out.

Thirty-five percent of practices have instituted hiring freezes, and 34% say they've cut operating budgets. Thirty-seven percent said that they have postponed capital expenditures.

Over one-third of the practices in the survey said that they saw an increase in the number of uninsured patients in 2008.

Solo and physician-owned small group practices have been especially hard hit by the recession, and increasingly they are reaching out to hospitals and the large group practices for a lifeline. MGMA surveys over the last decade show clearly that America's doctors are huddling up

and selling out to larger health care entities, Dr. Jessee said.

The number of MGMA member groups owned by hospitals grew by 20% during the 5-year period from 2003 to 2008, and they now comprise 10% of the organization's total membership.

During that time, the average number of physicians in MGMA member group practices increased from 16 in 2003 to 19 in 2008. The number of doctors in the

average hospital-owned group rose from 64 to 76, a 19% increase. "There's a big, big trend toward consolidation," Dr. Jessee said.

Not surprisingly, the economic downturn has also affected MGMA itself. The organization acknowledged that attendance at this year's annual meeting—roughly 2,150 paid attendees—was down 21% from its peak several years ago. ■

NEW 5 MG/4 MG CAPSULE PROVIDES DOSING OPTIONS.

**Inaccurate dosing
is a nightmare
waiting to happen.**

Improperly dosed cough suppressants can result in respiratory depression, and their normal use may impair motor skills and judgment. Consider the potential safety advantages of single-capsule BID dosing vs patient-measured TID/QID oral liquid dosing. For more information on just how frightening cough syrup can be, please visit www.capthecough.com.

INDICATION

TussiCaps® is indicated for the relief of cough and upper respiratory symptoms associated with allergy or a cold in adults and children 6 years of age and older. The 5/4 mg capsules are for use with children 6 to 11 years of age and the 10/8 mg capsules are for use with adults and children 12 years of age and older.

IMPORTANT RISK INFORMATION

TussiCaps® is contraindicated in children under 6 years of age (due to risk of fatal respiratory depression) and in the presence of known allergy or sensitivity to hydrocodone or chlorpheniramine. The most common adverse reactions associated with TussiCaps® are sedation, drowsiness, and mental clouding, which may impair mental and/or physical abilities required for potentially hazardous tasks such as driving or operating machinery. Overdose with hydrocodone-containing products has been associated with fatal respiratory depression. The possibility of tolerance and/or dependence, particularly in patients with a history of drug dependence and for drug interactions, including those with CNS depressants or antidepressants, should be considered. Benefit to risk ratio should be carefully considered, especially in pediatric patients with respiratory embarrassment.

Please see Brief Summary of Prescribing Information on following page.

TussiCaps® provides accurate dosing for up to 12 hours.
