# Rash May Cover Much of Body in Dengue Fever

BY BRUCE JANCIN

Denver Bureau

ASPEN, COLO. — Corticosteroids have no current role in the management of dengue fever, Dr. Suchitra Rao said a conference on pediatric infectious diseases sponsored by Children's Hospital, Denver, and the University of Colorado.

Systemic steroids have a long history of use in the most severe clinical manifestations of dengue fever: dengue hemorrhagic fever and dengue shock syndrome. Small observational studies suggested they were of possible benefit.

But a Cochrane Systematic Review of the only four published placebo-controlled trials showed no benefit for corticosteroids in patients with dengue shock syndrome. The studies totaling 284 participants, deemed by the Cochrane reviewers as studies "not of good quality," showed no significant impact upon mortality, need for blood transfusions, hospital length of stay,

or serious complications including pulmonary hemorrhage and seizures (Cochrane Database Syst. Rev. 2006; DOI:10.1002/14651858.CD003488.pub2).

There is, however, an ongoing randomized controlled trial evaluating the use of systemic steroids in patients with severe dengue-related retinopathy, including retinal vasculitis and exudative retinal detachment. The study was prompted by several favorable case reports along with a plausible mechanism of benefit—namely, that dengue retinopathy entails immune complex deposition, and early use of steroids may inhibit this process, explained Dr. Rao, a pediatric infectious diseases fellow at the hospital.

Dengue fever is an acute illness characterized by sudden onset of fever, headache, severe joint and muscle pain, lymphadenopathy, retro-orbital pain, and a characteristic widespread maculopapular rash that may cover much of the body except for the face. The rash usually appears at the end of the fever, which lasts 5-7 days.

More than 40% of the world's population live in areas at risk for dengue fever. Children under age 10 years are most often affected. The diagnosis is most often made on the basis of a positive IgM capture enzyme-linked immunoassay test; however, this test becomes positive only beginning on day 4 or 5 after symptom onset. Polymerase chain reaction testing has acceptable sensitivity only during the first few days of the illness; by day 7 the sensitivity of PCR declines to less than 10%.

A low platelet count and increased hematocrit indicate increased likelihood that a patient will develop dengue hemorrhagic fever or shock syndrome.

Prompt fluid replacement as described in World Health Organization guidelines is the key to curbing mortality.

riatric Use: A limited number of patients at or above 60 years of age (n - 396) have been treated with OXISTAT arm in US and non-US clinical trials, and a limited number (n = 43) have been treated with OXISTAT\* Lotion in lical trials. The number of patients is too small to permit separate analysis of efficacy and safety. No adverse ere reported with OXISTAT\* Lotion in geriatric patients, and the adverse reactions reported with OXISTAT\* Crear population were similar to those reported by younger patients. Based on available data, no adjustment of dos ISTAT\* Cream and Lotion in geriatric patients is warranted.

OXISTAT® (oxiconazole nitrate cream) Cream, 1%\* OXISTAT® (oxiconazole nitrate lotion) Lotion, 1%\*

FOR TOPICAL DERMATOLOGIC USE ONLY— NOT FOR OPHTHALMIC OR INTRAVAGINAL USE

R-only

nonunitate.
The compound has the molecular formula C<sub>18</sub>H<sub>13</sub>ON<sub>3</sub>Cl<sub>4</sub>+HNO<sub>3</sub>, a molecular weight of 492.15, and the following structural formula:

white crystal-line powder, soluble in methanol; sparingly soluble in ethanol, chloro-tly soluble in water.

and acetone; and a nearly writted vysala-nile power, soluble in neutration, spanning soluble in reliation, children and acetone; and very slightly soluble in water. STAT\* Cream contains 10 mg of oxiconazole per gram of cream in a white to off-white, opaque cream base of ad water USP, white petrolatum USP, stearyl alcohol NF, propylene glycol USP, polysorbate 60 NF, cetyl alcohol NF, enzoic acid USP 0.2% as a preservative.

STAT\* Lotion contains 10 mg of oxiconazole per gram of lotion in a white to off-white, opaque lotion base of purivater USP, white petrolatum USP, stearyl alcohol NF, propylene glycol USP, polysorbate 60 NF, cetyl alcohol NF, enzoic acid USP 0.2% as a preservative.

CLINICAL PHARMACOLOGY

Pharmacokinetics: The penetration of oxiconazole nitrate into different layers of the skin was assessed using an in vitro permeation technique with human skin. Five hours after application of 2.5 mg/cm² of oxiconazole nitrate cream onto human skin, the concentration of oxiconazole nitrate was demonstrated to be 16.2 µmol in the epidemis, 3.64 µmol in the upper corium, and 1.29 µmol in the deeper corium. Systemic absorption of oxiconazole nitrate is low. Using radiolabeled drug, less than 0.3% of the applied dose of oxiconazole nitrate was recovered in the urine of volunteer subjects up to 5 days after application of the cream formulation.

Neither in vitro nor in vivo studies have been conducted to establish relative activity between the lotion and cream formulation.

ons.

Jogy: Oxiconazole nitrate is an imidazole derivative whose antifungal activity is derived primarily from the inhiergosterol biosynthesis, which is critical for cellular membrane integrity. It has in vitro activity against a wide
pathogenic fungi.

azole has been shown to be active against most strains of the following organisms both in vitro and in clinical
at indicated body sites (see INDICATIONS AND USAGE):

The state of the s

CONTRAINDICATIONS
OXISTAT® Cream and Lotion are contraindicated in individuals who have shown hypersensitivity to any of their com-

oxiconazole nitrate cream) Cream, 1% and OXISTAT\* (oxiconazole nitrate lotion) Lotion, 1% are intravaginal use.

only.

2. Use the medication for the **full** treatment time recommended by the physician, even though symptoms may have improved. Notify the physician if there is no improvement after 2 to 4 weeks, or sooner if the condition worsens (see

ow). rm the physician if the area of application shows signs of increased irritation, itching, burning, blistering, swelling

interactions: Potential drug interactions between OXISTAT\* and other drugs have not been systematically evaluating ensels, Mutagenesis, Impairment of Fertility: Although no long-term studies in animals have been pered to evaluate caromogenic potential, no evidence of mutagenic effect was found in 2 mutation assays (Ames test Chinese hamster V70 in vitro cell mutation assay) or in 2 cytogenetic assays (human peripheral blood lymphocyte ro roundous assays in mice). Productive studies revealed no impairment of fertility in rats at oral doses of 3 mg/kg/day in females (1 time the an dose based on mg/m²) and 15 mg/kg/day in males (4 times the human dose based on mg/m²). However, at so above this level, the following effects were observed: a reduction in the fertility parameters of males and females, fuction in the number of sperm in vaginal smears, extended estrous cycle, and a decrease in mating frequency, manory. Terafogenic Effects: Pregnancy Category B. Reproduction studies have been performed in rabbits, rats, mice at oral doses up to 100, 150, and 200 mg/kg/day (57, 40, and 27 times the human dose based on mg/m²), sectively, and revealed no evidence of harm to the fetus to oxiconazole nitrate. There are, however, no adequate and well-controlled studies in pregnant women. Because at perpoduction studies are not always preciditive of human response, this drug should be used during pregnancy if clearly needed.

ause oxiconazole is excreted in human milk, caution should be exercised when the drug is

administered to a nursing woman.

Pediatric Use: OXISTAT\* Cream may be used in pediatric patients for tinea corporis, tinea cruris, tinea pedis, and tinea (bityriasis) versicolor; however, these indications for which OXISTAT\* Cream has been shown to be effective rarely occur in children below the age of 12.

tions were applied to the clinical and microbiological outcomes in patients enrolled in the clinical is for the approvals of OXISTAT® Lotion and OXISTAT® Cream.

cal Cure: No evidence (culture and KOH preparation) of the baseline (original) pathogen in a speced area taken at the 2-week post-treatment visit (for tinea [pityriasis] versicolor, mycological cure

the affected area taken at the 2-week post-treatment visit (for tinea [pitynasis] versicoior, myconogical cure was immed to KOH only).

Treatment Success: Both a global evaluation of 90% clinical improvement and a microbiologic eradication (see above) at the 2-week post-treatment visit.

Tinea Pedis: THERE ARE NO HEAD-TO-HEAD COMPARISON TRIALS OF THE OXISTAT® CREAM AND LOTION FORHULATIONS IN THE TREATMENT OF TINEA PEDIS.

Lotion Formulation: The clinical trial for the lotion formulation line extension involved 332 evaluable patients with initically and microbiologically established tinea pedis. Of these evaluable patients, 64% were diagnosed with hypereratotic plantar tinea pedis and 28% with interdigital tinea pedis. Seventy-seven percent (77%) had disease secondary infection with Trichophyton rubrum, 18% had disease secondary to infection with Trichophyton mentagrophytes, and % had disease secondary infection with Trichophyton mentagrophytes, and with the secondary to infection with Trichophyton mentagrophytes, and with the secondary to infection with Trichophyton mentagrophytes, and with the secondary to infection with Trichophyton mentagrophytes, and with the secondary to infection with Trichophyton mentagrophytes, and with the secondary to infection with Trichophyton mentagrophytes. The results of this clinical trial at the 2-week post-treatment follow-up visit are shown in the following table:

|                                       | OXISTAT® Lotion |            |            |
|---------------------------------------|-----------------|------------|------------|
| Patient Outcome                       | b.i.d.          | q.d.       | Vehicle    |
| Mycological cure<br>Treatment success | 67%<br>41%      | 64%<br>34% | 28%<br>10% |

In this study, the improvement and cure rates of the b.i.d.- and q.d.-treated groups did not differ significantly (95% onfidence interval) from each other but were statistically (95% confidence interval) superior to the vehicle-treated

|                                       | OXISTA     | OXISTAT® Cream |            |
|---------------------------------------|------------|----------------|------------|
| Patient Outcome                       | b.i.d.     | q.d.           | Vehicle    |
| Mycological cure<br>Treatment success | 77%<br>52% | 79%<br>43%     | 33%<br>14% |

|                                       | OXISTAT® Cream |            |
|---------------------------------------|----------------|------------|
| Patient Outcome                       | q.d.           | Vehicle    |
| Mycological cure<br>Treatment success | 88%<br>83%     | 67%<br>62% |

Only once a day was shown in both studies to be statistically superior to vehicle for all efficacy parameters at 2 eeks and follow-up.

## No Link Found Between Lichen Sclerosis, Lyme

ZURICH — Borrelia burgdorferi infection is unlikely to play a role in the pathogenesis of male genital lichen sclerosis, Dr. Emma V. Edmonds said at the annual meeting of the European Society for Dermatological Research.

Since the skin manifestations of Lyme disease and lichen sclerosis share histologic and clinical similarities, some investigators have argued that the spirochete B. burgdorferi is implicated in male lichen sclerosis and have recommended oral antibiotics for affected individuals, said Dr. Edmonds of Chelsea and Westminster Hospital, London.

To determine whether there is serologic evidence of a B. burgdorferi/lichen sclerosis connection, she and her coinvestigators analyzed sera from 30 patients with biopsy-proven male genital lichen sclerosis and 32 male age-matched controls.

All 62 subjects proved negative for B. burgdorferi by enzyme-linked immunosorbent assay (ELISA). On IgG Western immunoblot, one control subject was positive and three were equivocal, as were five patients with genital lichen sclerosis. The other 53 participants were negative for B. burgdorferi by Western immunoblot.

Since there is no role for antibiotics, treatment for male genital lichen sclerosis remains potent topical corticosteroids or circumcision. There can be sexual dysfunction, and transformation to squamous cell carcinoma also can occur.
