16. Abstract                   BACKGROUND:  
The most appropriate targets for systolic blood pressure to reduce cardiovascular morbidity and mortality among persons without diabetes remain uncertain.  
METHODS:  
We randomly assigned 9361 persons with a systolic blood pressure of 130 mm Hg or higher and an increased cardiovascular risk, but without diabetes, to a systolic blood-pressure target of less

than 120 mm Hg (intensive treatment) or a target of less than 140 mm Hg (standard treatment). The primary composite outcome was myocardial infarction, other acute coronary syndromes, stroke, heart failure, or death from cardiovascular causes.

**RESULTS:**

At 1 year, the mean systolic blood pressure was 121.4 mm Hg in the intensive-treatment group and 136.2 mm Hg in the standard-treatment group. The intervention was stopped early after a median follow-up of 3.26 years owing to a significantly lower rate of the primary composite outcome in the intensive-treatment group than in the standard-treatment group (1.65% per year vs. 2.19% per year; hazard ratio with intensive treatment, 0.75; 95% confidence interval [CI], 0.64 to 0.89;  $P < 0.001$ ). All-cause mortality was also significantly lower in the intensive-treatment group (hazard ratio, 0.73; 95% CI, 0.60 to 0.90;  $P = 0.003$ ). Rates of serious adverse events of hypotension, syncope, electrolyte abnormalities, and acute kidney injury or failure, but not of injurious falls, were higher in the intensive-treatment group than in the standard-treatment group.

**CONCLUSIONS:**

Among patients at high risk for cardiovascular events but without diabetes, targeting a systolic blood pressure of less than 120 mm Hg, as compared with less than 140 mm Hg, resulted in lower rates of fatal and nonfatal major cardiovascular events and death from any cause, although significantly higher rates of some adverse events were observed in the intensive-treatment group. (Funded by the National Institutes of Health; ClinicalTrials.gov number, NCT01206062.)

| <b>1.</b> Number of patients starting each arm of the study?   | 4678 intensive; 4683 control  |
| <b>2.</b> Main characteristics of study patients (inclusions, exclusions, demographics, settings, etc.)?           | age 50+<br>SBP 130-180<br>One of the following:<br>clinical or subclinical CV disease except stroke<br>CKD except PCKD<br>Age >75<br>10year Framingham risk of 15% or greater<br>Exclusion: DM                          |
| <b>3.</b> Intervention(s) being investigated?  | goal SBP 120 or less  |
| <b>4.</b> Comparison treatment(s), placebo, or nothing?  | Goal SBP of 135-139   |
| <b>5.</b> Length of follow up? Note specified end points e.g. death, cure, etc.                                    | mean 3.26 years   |
| <b>6.</b> What outcome measures are used? List all that assess effectiveness.                                      | composite of MI, acute coronary syndrome without MI, acute heart failure or death from any cardiovascular cause   |
| <b>7.</b> What is the effect of the intervention(s)? Include absolute risk, relative risk, NNT, CI, p-values, etc. | 243 of 4683 (5.2%) patients in the intensive treatment group experienced the primary outcome, compared with 319/4683 (6.8%) in the standard treatment group (ARR: 1.6%, NNT: 63, $p < 0.001$ )                          |
| <b>8.</b> What are the adverse effects of intervention compared with no intervention?                              | serious AEs 38.3 vs 37.1% ( $p = 0.25$ ); orthostatic hypotension 4.7% intensive vs 2.5% control; risk of new kidney disease in people without known kidney disease: 1.21%/year intensive 0.35% control ( $p < 0.001$ ) |

9. Study addresses an appropriate and clearly focused question - **select one**

- Well covered
- Adequately addressed
- Poorly addressed
- Not applicable

Comments:

10. Random allocation to comparison groups

- Well covered
- Adequately addressed
- Poorly addressed
- Not applicable

Comments:

11. Concealed allocation to comparison groups

- Well covered
- Adequately addressed
- Poorly addressed
- Not applicable

Comments:

12. Subjects and investigators kept "blind" to comparison group allocation

- Well covered
- Adequately addressed
- Poorly addressed
- Not applicable

Comments:

12. Comparison groups are similar at the start of the trial

- Well covered
- Adequately addressed
- Poorly addressed
- Not applicable

Comments:

14. Were there any differences between the groups/arms of the study other than the intervention under investigation? If yes, please indicate whether the differences are a potential source of bias.

- Well covered
- Adequately addressed
- Poorly addressed
- Not applicable

Comments:

15. Were all relevant outcomes measured in a standardized, valid, and reliable way?

- Well covered
- Adequately addressed
- Poorly addressed
- Not applicable

Comments:

16. Are patient oriented outcomes included? If yes, what are they?

No

17. What percent dropped out, and were lost to follow up? Could this bias the results? How?

111 in intensive; 134 in control

18. Was there an intention-to-treat analysis? If not, could this bias the results?

Yes

How?

19. If a multi-site study, are results comparable for all sites? Yes
20. Is the funding for the trial a potential source of bias? If yes, what measures were taken to insure scientific integrity? n/a
21. To which patients might the findings apply? Include patients in the study and other patients to whom the findings may be generalized. People without diabetes at high risk of CV disease with hypertension
22. In what care settings might the findings apply, or not apply? primary care, cards
23. To which clinicians or policy makers might the findings be relevant? primary care, cards

**SECTION 4: Conclusions**  
**[to be completed by the Potential PURL Reviewer]**  
**[to be revised by the Pending PURL Reviewer as needed]**

1. **Validity:** How well does the study minimize sources of internal bias and maximize internal validity?

Give one number on a scale of 1 to 7  
(1=extremely well; 4=neutral; 7=extremely poorly)  
1 2 3 4 5 6 7

2. If 4.1 was coded as 4, 5, 6, or 7, please describe the potential bias and how it could affect the study results. Specifically, what is the likely direction in which potential sources of internal bias might affect the results?

3. **Relevance:** Are the results of this study generalizable to and relevant to the health care needs of patients cared for by "full scope" family physicians?

Give one number on a scale of 1 to 7  
(1=extremely well; 4=neutral; 7=extremely poorly)  
1 2 3 4 5 6 7

4. If 4.3 was coded as 4, 5, 6, or 7, please provide an explanation.

**5. Practice changing**

**potential:** If the findings of the study are both valid and relevant, does the practice that would be based on these findings represent a change from current practice?

6. If 4.5 was coded as 1, 2, 3, or 4, please describe the potential new practice recommendation. Please be specific about what should be done, the target patient population and the expected benefit.

**7. Applicability to a Family**

**Medical Care Setting:**

Is the change in practice recommendation something that could be done in a medical care setting by a family physician (office, hospital, nursing home, etc), such as a prescribing a medication, vitamin or herbal remedy; performing or ordering a diagnostic test; performing or referring for a procedure; advising, educating or counseling a patient; or creating a system for implementing an intervention?

8. If you coded 4.7 as a 4, 5, 6 or 7, please explain.

**9. Immediacy of**

**Implementation:** Are there major barriers to immediate implementation? Would the cost or the potential for reimbursement prohibit implementation in most family medicine practices? Are there regulatory issues that prohibit implementation? Is the service, device, drug or other essentials available on the market?

10. If you coded 4.9 as 4, 5, 6, or 7, please explain why.

**11. Clinical meaningful outcomes or patient oriented outcomes:**

Are the outcomes measured in the study clinically meaningful or patient oriented?

Give one number on a scale of 1 to 7

(1=definitely a change from current practice; 4=uncertain; 7=definitely not a change from current practice)

1 2 3 4 5 6 7

Give one number on a scale of 1 to 7

(1=definitely could be done in a medical care setting; 4=uncertain; 7=definitely could not be done in a medical care setting)

1 2 3 4 5 6 7

Give one number on a scale of 1 to 7

(1=definitely could be immediately applied; 4=uncertain; 7=definitely could not be immediately applied)

1 2 3 4 5 6 7

Give one number on a scale of 1 to 7

(1=definitely clinically meaningful or patient oriented; 4=uncertain; 7=definitely not clinically meaningful or patient oriented)

1 2 3 4 5 6 7

12. If you coded 4.11 as a 4, 5, 6, or 7 please explain why.

13. In your opinion, is this a Pending PURL?

Criteria for a Pending PURL:

- Valid: Strong internal scientific validity; the findings appears to be true.
- Relevant: Relevant to the practice of family medicine
- Practice changing: There is a specific identifiable new practice recommendation that is applicable to what family physicians do in medical care settings and seems different than current practice.
- Applicability in medical setting:
- Immediacy of implementation

14. Comments on your response in 4.13

Give one number on a scale of 1 to 7

(1=definitely a Pending PURL; 4=uncertain; 7=definitely not a Pending PURL)

1 2 3 4 5 6 7
